Redes Neuronales

Tarea 2: Dataset Breast Cancer Winsconsin (Original)

Realizado por: David Fabián Cevallos Salas

Fecha: 2023-07-13

En esta tarea analizaremos el dataset Breast Cancer Wisconsin (Original) mediante árboles de decisión y la estrategia k-folding cross validation.

Se debe tener cargado el fichero de nombre breast-cancer-wisconsin.txt y el script MetricasBinario.m en la carpeta previo a la ejecución del live script.

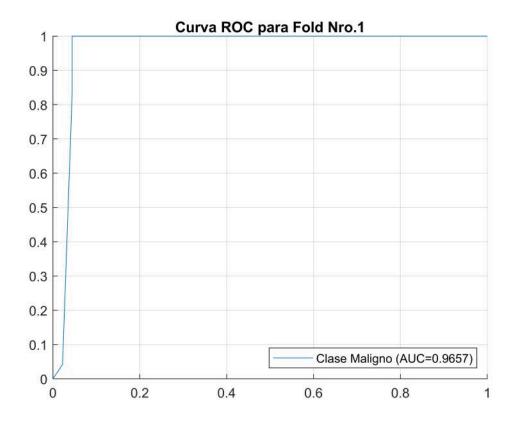

El dataset se encuentra disponible en: https://archive.ics.uci.edu/dataset/15/breast+cancer+wisconsin +original

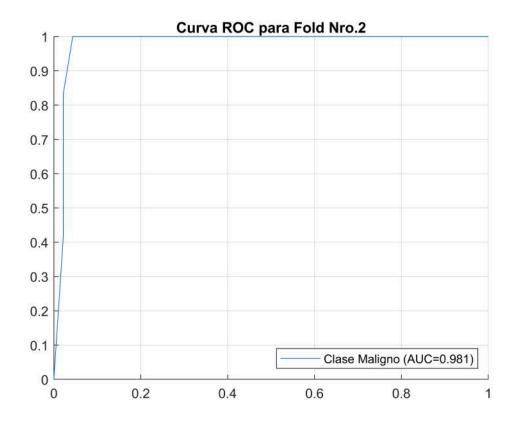

Consta de 9 descriptores y 699 observaciones. Comprende un problema de clasificación binaria.

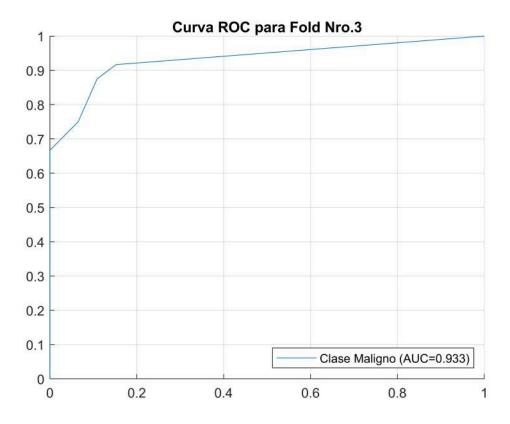

La solución correspondiente en Python se encuentra en: https://colab.research.google.com/drive/1GYhFC8l4m7GvtLpAdIULtzYFD-TgK4tC#scrollTo=-9oJ9DCAk54R

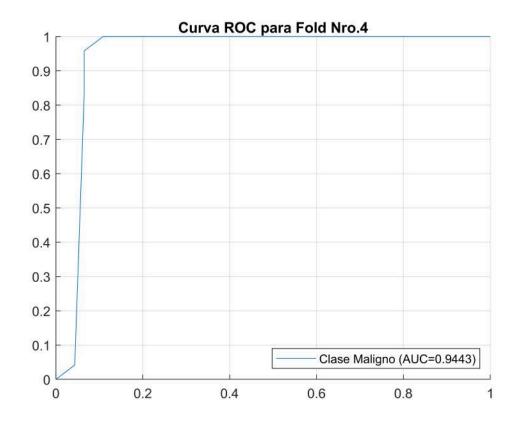

```
clc;
clear;
rng(0);
% Lectura de datos
T = readtable("breast-cancer-wisconsin.txt", "ReadVariableNames", false);
% Limpieza de datos
T(T.Var7=="?",7)={'1'};
T.Var7 = str2double(T.Var7);
T(T.Var11==2,11)={1};
T(T.Var11==4,11)={2};
% Establecimiento de datos finales y definición de estrategia k-Fold (10 folds)
X = table2array(T(:,2:10));
Y = table2array(T(:,11));
CVO = cvpartition(Y, "k", 10);
num_pruebas = CVO.NumTestSets;
labels = [1 2];
for i = 1:num_pruebas
    % Indices de training y test
    trIdx = CVO.training(i);
    teIdx = CVO.test(i);
    % Definición de modelo Decision Tree
    ctree = fitctree(X(trIdx,:),Y(trIdx,:));
```

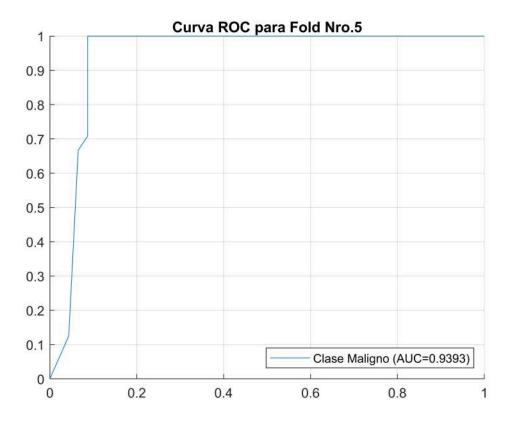

```
% Predicción: etiquetas y probabilidades
[Ypred, Yproba] = predict(ctree,X(teIdx,:));
% Obtención de métricas (Definimos como clase positiva
% a la clase 2 - Maligno)
Met(:,i)=MetricasBinario(Y(teIdx,:), Ypred, Yproba, 2, "Maligno", i);
end
```

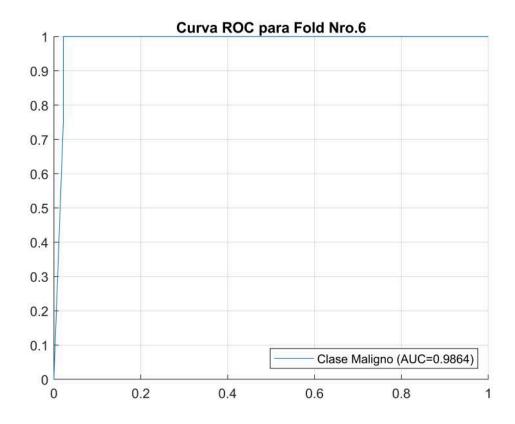

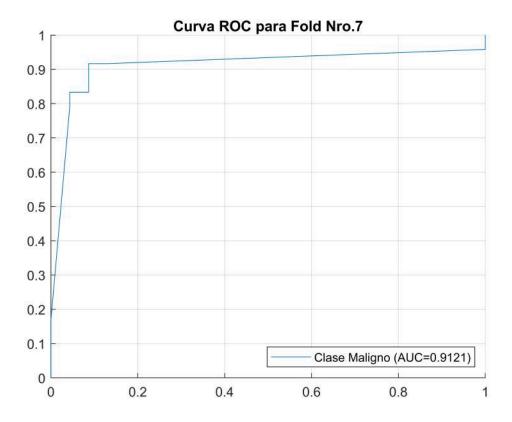

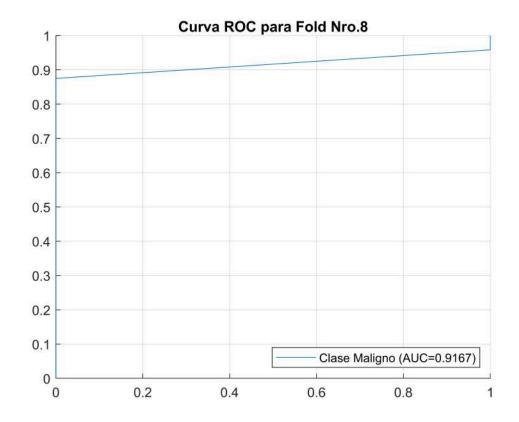

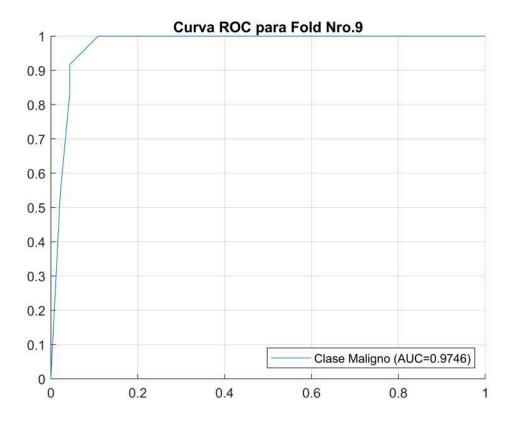

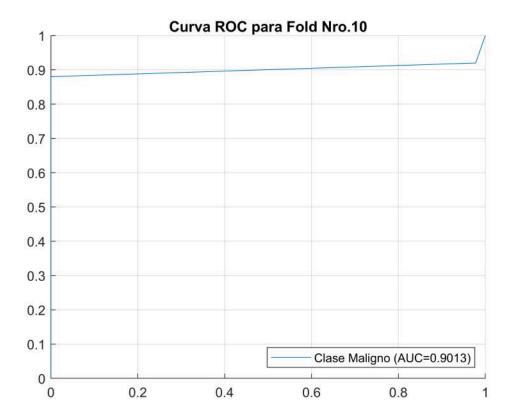

```
% Valores de media de métricas obtenidas
% Precision, Recall, F1-score, Accuracy, Error, AUC score
Metricas = mean(Met,2)
```

0.9021 0.9297 0.9128 0.9385 0.0615
